VR4MAX Generator

VR4MAX Generator bundles three VR4MAX functions into a complete VR solution. Export your models from Autodesk 3ds Max and VIZ to VR4MAX with the Translator. Manipulate, navigate through your models, and render stereo views with the Navigator Pro. Create executable files with the publisher, an extremely user friendly way to share your models.

VR4MAX Translator for Windows is the interface between Autodesk 3ds Max and VIZ, and VR4MAX. The Translator exports your model from within your modelling environment to VR4MAX and gives you immediate access to the fully rendered model in real-time.

VR4MAX Navigator Pro is the virtual reality environment where you can navigate through and manipulate your model. Just load the .vmx file generated by the Translator and you are ready to move freely through the model. Navigator Pro supports features like basic stereo rendering, screen dumps, 3D positional sound, individual animation by multiple time-lines, event/action driven behavior, system calls, mesh reduction, levels of detail creation tools, and more. Also head tracking and 3D navigation, such as the 3Dconnexion or Trioc devices are supported.

VR4MAX publisher allows you to pack your VR4MAX model, the VR4MAX Render Engine and a user friendly graphical interface into one single executable file that plays all VR4MAX behavior. This file can be used to distribute your interactive designs, and gives you full control over what end-user can and can't do. This is suitable for sending your designs to your customers, or for displaying your designs in a public kiosk at an exhibition, info center, and so on. Sharing your designs was never so easy and safe!

The functionality of Generator can be greatly extended by adding VR4MAX Option Packs and Advanced VR4MAX Applications.
